

## LSXPS: The Living Swift-XRT Point Source catalogue

Phil Evans  
University of Leicester

- Because there's so much more serendipitous science that "planned" science.
- Serendipitous science is discovery space.
- Including for transients — see for example the "Fast X-ray Transients" from Chandra data, or QPEs from XMM (and other) data.

- X-ray catalogues are always out of date!
  - 2SXPS: Published 2019 November; last dataset: 2018 August
    - 15 month delay.
  - 4XMM-DR13: Published 2023 June; last dataset: 2022 December
    - 6 month delay!
- Not so great for transient follow up...!
  - Of course, MAXI and eRosita have low-latency transient pipelines.
- Catalogues are also important references, e.g. for multi-messenger response.
  - **Upper limit calculators are really valuable.**

- Daily average of ~45 fields/day in “PC mode”.
- Median exposure: ~900 s
  - Sensitivity:  $2 \times 10^{-13}$  erg cm<sup>-2</sup> s<sup>-1</sup>.
- How often do we expect to find transients?

- Daily average of  $\sim 45$  fields/day in “PC mode”.
- Median exposure:  $\sim 900$  s
  - Sensitivity:  $2 \times 10^{-13}$  erg cm $^{-2}$  s $^{-1}$ .
- How often do we expect to find transients? **We don't know!**

- January 7<sup>th</sup>, 2008, Swift-UVOT observed SN2007iy.
- January 9th, Swift-UVOT observed it again.
  - And also a new supernova...
  - ... also seen in X-rays.

SN2008D.  
Soderberg, Starling et al

- January 7<sup>th</sup>, 2008, Swift-UVOT observed SN2007iy.
- January 9th, Swift-UVOT observed it again.
  - And also a new supernova...
  - ... also seen in X-rays.
- What are the chances....?

SN2008D.  
Soderberg, Starling et al

5 10 15

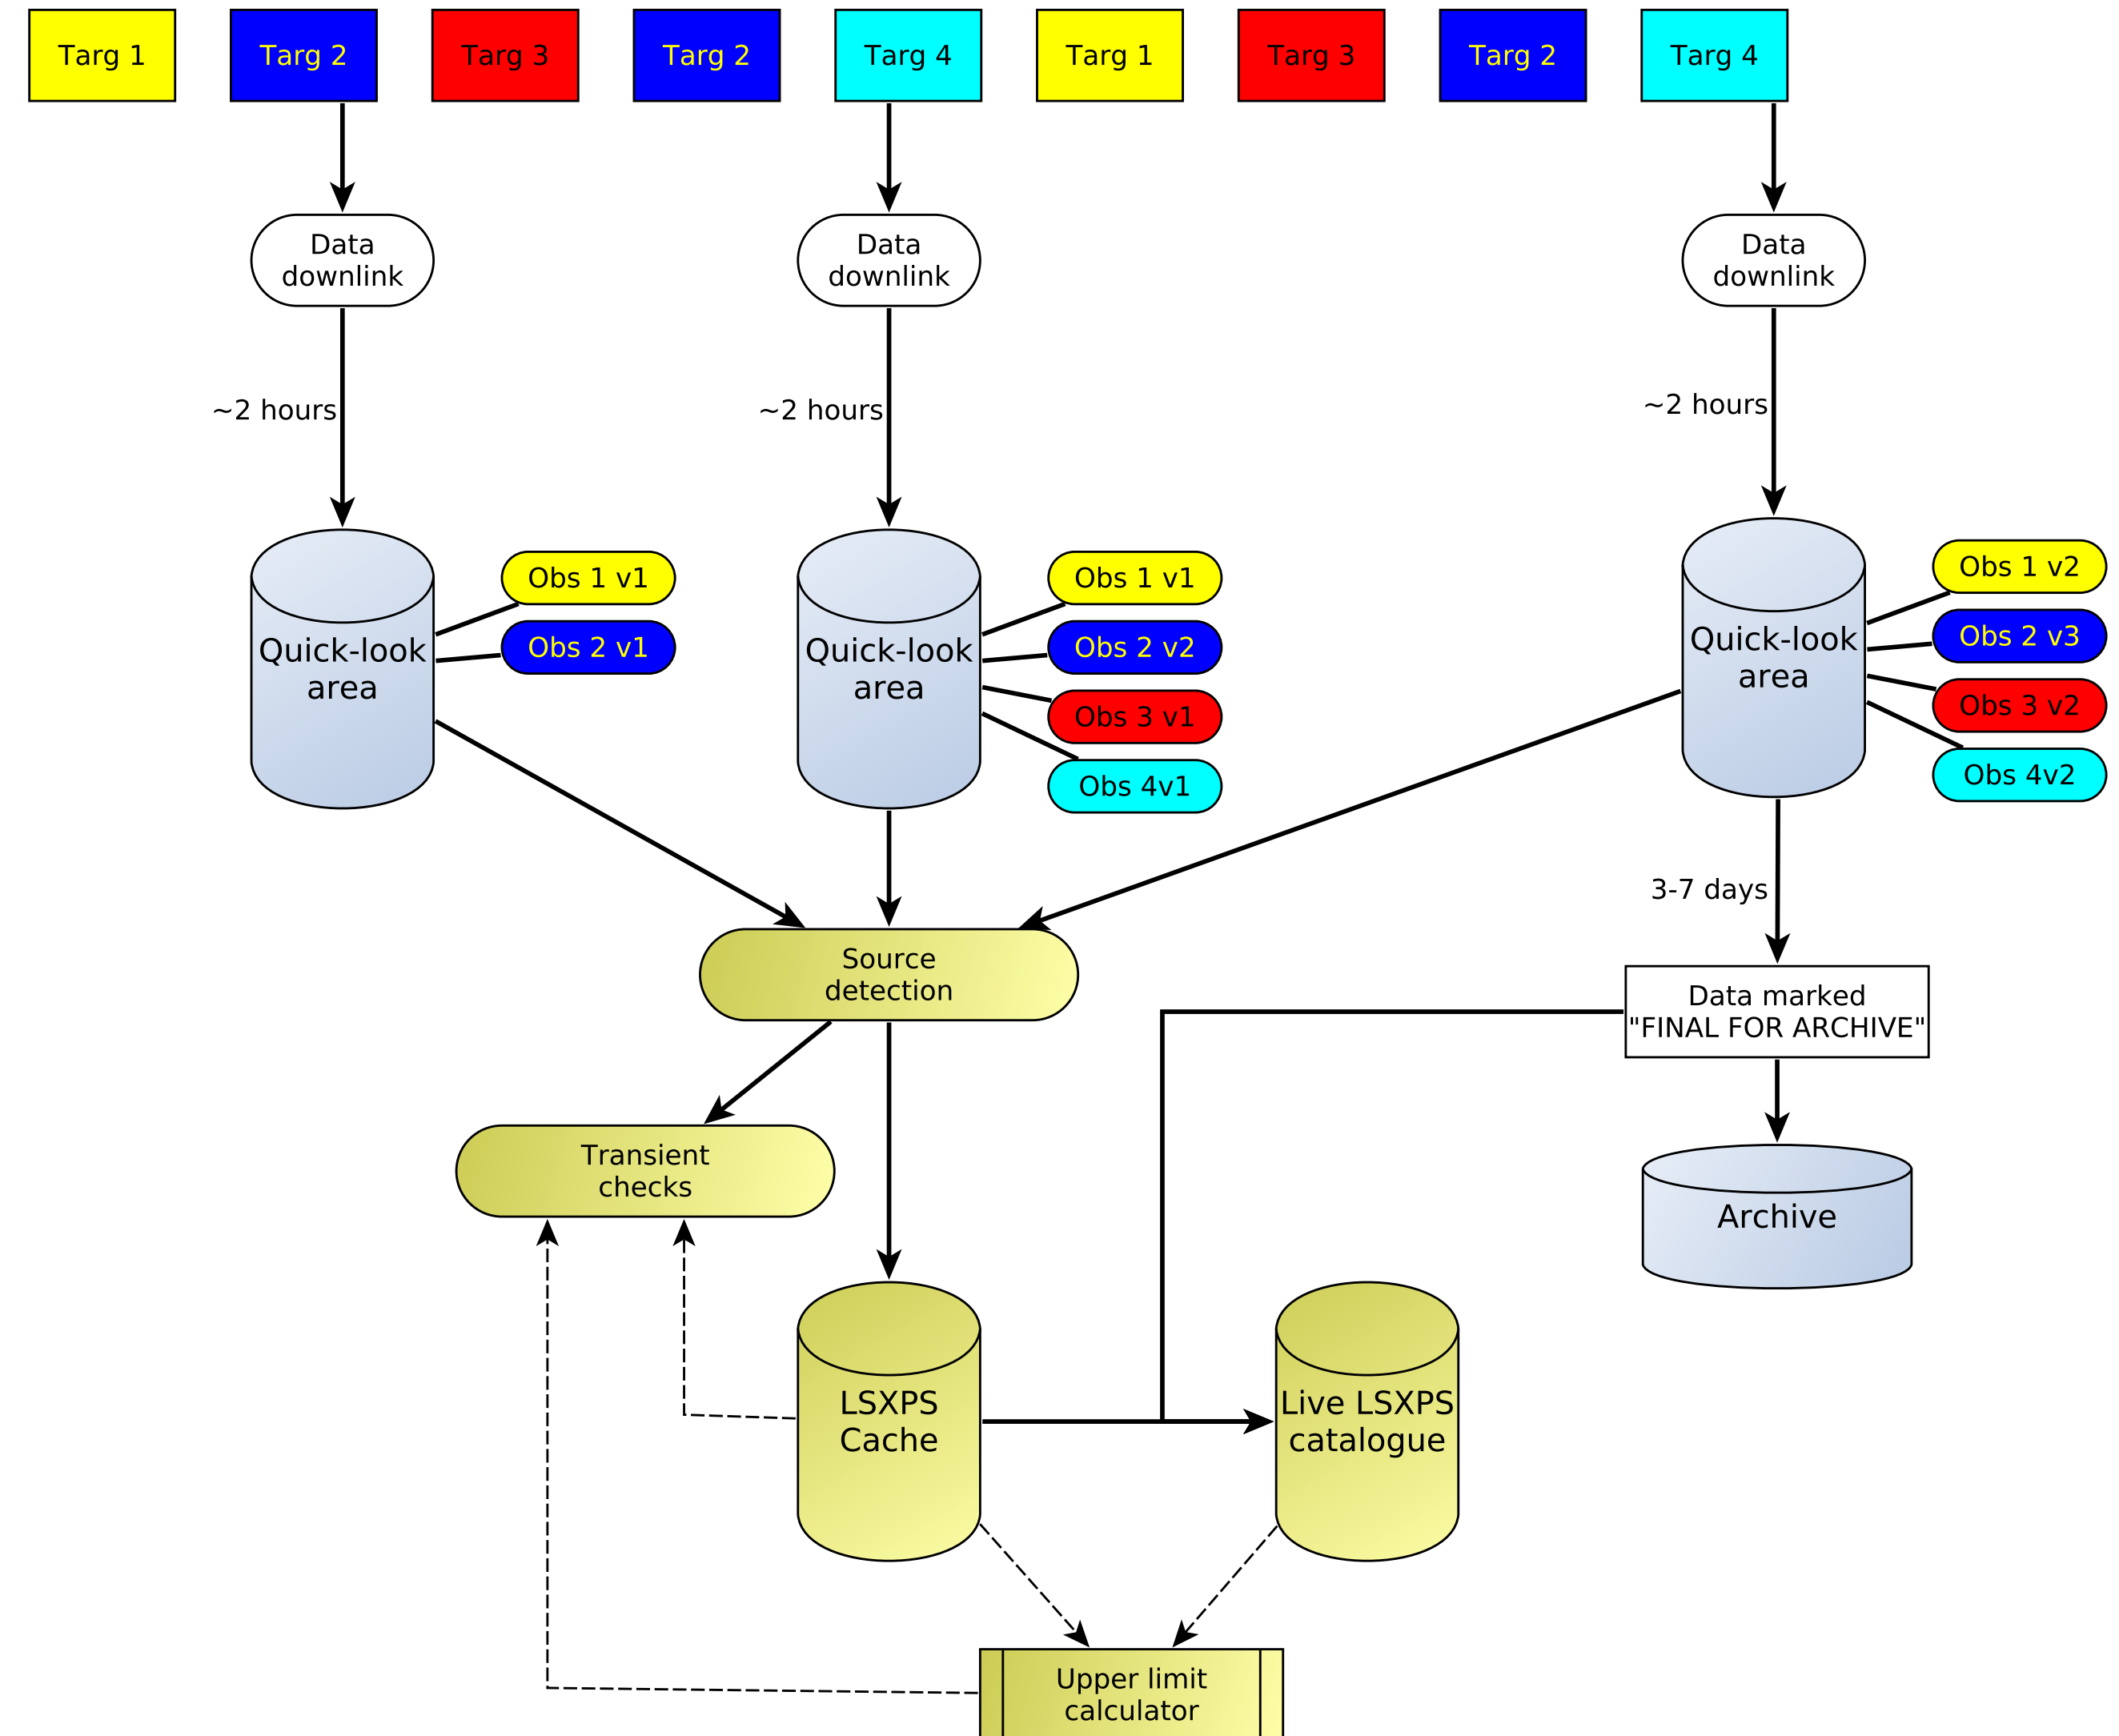

- January 7<sup>th</sup>, 2008, Swift-UVOT observed SN2007iy.
- January 9th, Swift-UVOT observed it again.
  - And also a new supernova...
  - ... also seen in X-rays.
- What are the chances.....?
  - We don't really know (quite low, probably).
    - But relying on the observer to spot it reduces them!

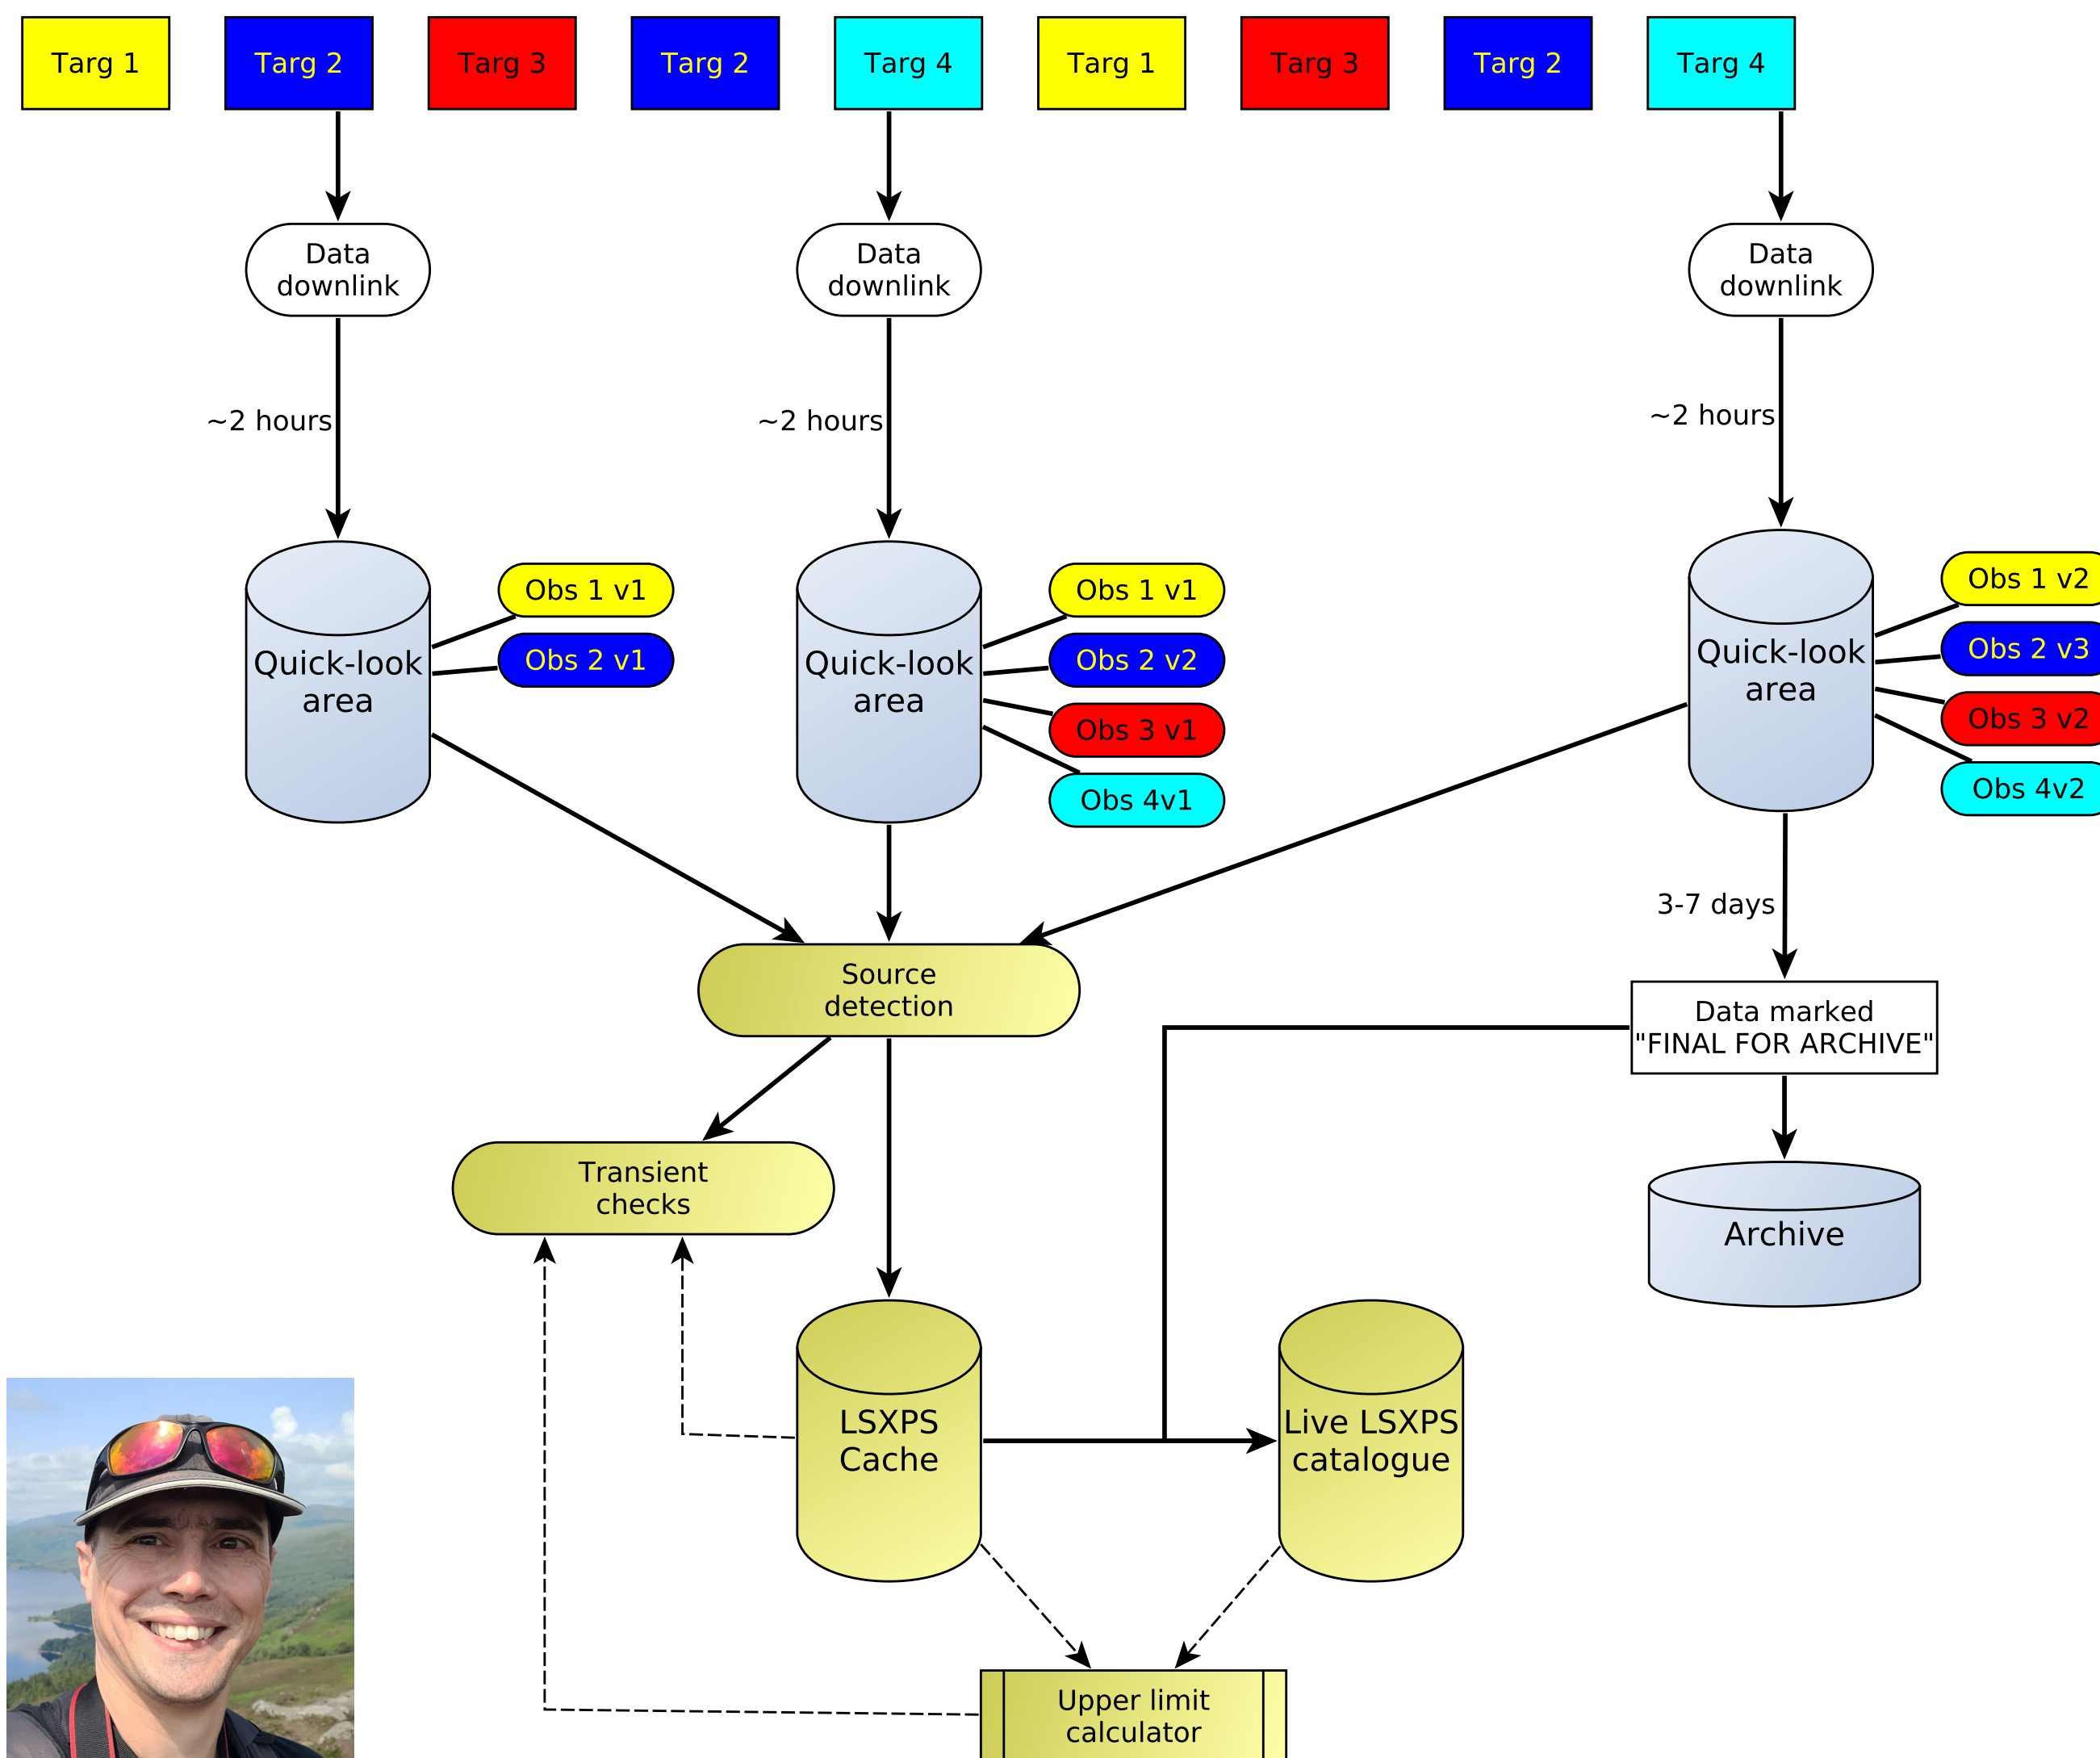

SN2008D.  
Soderberg, Starling et al

- *Swift* does multiple downlinks per day, but makes data available ASAP — “quicklook”.
- “quicklook” data can be incomplete, or even corrupt.
- LSXPS has a “cache” and “live” system.
  - Check for transients in the cache.
  - Only put “live” data in the catalogue.

- *Swift* does multiple downlinks per day, but makes data available ASAP — “quicklook”.
- “quicklook” data can be incomplete, or even corrupt.
- LSXPS has a “cache” and “live” system.
- Check for transients in the cache.
- Only put “live” data in the catalogue.

The team:

Stats as of Feb 26

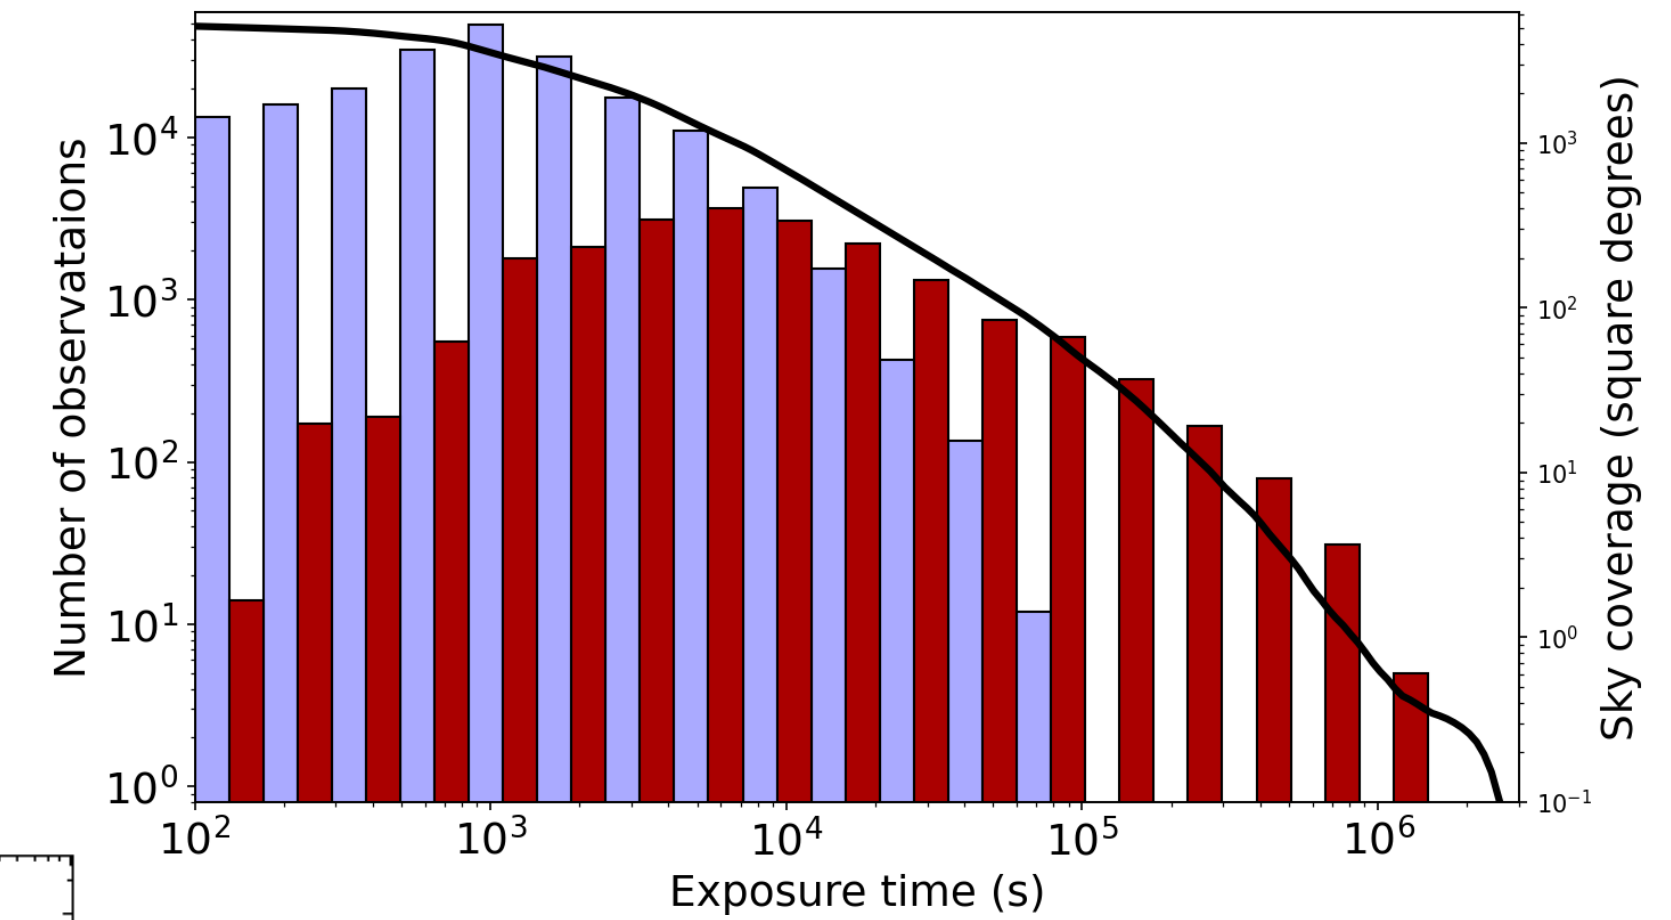

~113 million photons

<b>Data included</b>	2005-01-01 — 2024-02-17 (376 Ms)
<b>Sky coverage</b>	5,489 square degrees
<b>Detections</b>	2,196,304
<b>Unique sources</b>	312,211
<b>Variable sources</b>	121,928
<b>Uncatalogued sources</b>	103,365

<https://www.swift.ac.uk/LSXPS>

<https://www.swift.ac.uk/API>

- Unique sky coverage increases by  $\sim 0.8 \text{ deg}^2 / \text{day}$ .
- $\sim 50$  new unique sources /day.
- Typical “latency” is 7 days for the main catalogue.
- Median 0.3-10 keV flux:  $\sim 4 \times 10^{-14} \text{ erg cm}^{-2} \text{ s}^{-1}$ .

<b>Data included</b>	2005-01-01 — 2024-02-17 (376 Ms)

Blind searches don't find everything:  
targeted photometry is more sensitive.  
Some 'transients' are 'outbursts'.

Spurious detections often come up as transient.

- Optical loading (as right).
- Noisy quick-look data.
- Other artifacts.

Most transients are “low significance”.

- Eddington bias suggests many are not transient.
- Ongoing work (Srijan) to improve this classification.

**Status:** Confirmed transient  
**Announced?** Yes — via release of discovery dataset.

## LSXPS: The “Living” Swift-XRT Point Source Catalogue.

- A low-latency, constantly-updated X-ray catalogue.
- Near real-time transient detection.
  - Currently, human verification before transients are published.
- Grows at  $\sim 0.8 \text{ deg}^2/\text{day}$ ; 50 new sources/day.
- Typical sensitivity / observation =  $2e-13 \text{ cgs}$ .
